

# HPY Cone Crusher Technical Parameters

This sheet summarizes the reference model range and capacity data for the **HPY Multi-cylinder Hydraulic Cone Crusher**. It is prepared for preliminary model screening, not as a fixed performance guarantee. Final selection should be checked with feed size, chamber type, CSS, screen opening, return load, rock hardness and moisture.

## Basic Technical Scope

| Item                           | Technical Reference  |
|--------------------------------|--|
| <b>Product name</b>            | HPY Multi-cylinder Hydraulic Cone Crusher  |
| <b>Crushing stage</b>          | Secondary, tertiary and fine crushing  |
| <b>Applicable materials</b>    | Granite, basalt, diabase, river pebble, limestone, dolomite, iron ore, copper ore and other medium-hard to hard materials            |
| <b>CSS / discharge opening</b> | 6-64 mm tight-side discharge opening / closed side setting (CSS), depending on model and chamber type                                |
| <b>Reference capacity</b>      | Approx. 20-3000 t/h by model, CSS and plant configuration  |
| <b>Typical models</b>          | HPY-100, HPY-200, HPY-300, HPY-400, HPY-500, HPY-800, HPY-1000, HPY-1250   |
| <b>Core configuration</b>      | Fixed main shaft, eccentric bushing, laminated crushing chamber, hydraulic CSS adjustment, tramp iron release and hydraulic clearing |

## Capacity Table Reading Notes

| Selection factor               | What to confirm before using the capacity table  |
|--------------------------------|--|
| <b>CSS / discharge opening</b> | Smaller CSS normally gives finer output, but may reduce throughput, increase liner wear and raise return load.             |
| <b>Feed grading</b>            | Stable and well-distributed feed keeps the chamber full; segregated feed or too many fines reduces efficiency.             |
| <b>Material hardness</b>       | Basalt, granite, diabase and metallic ore require attention to chamber selection, motor load and liner wear.               |
| <b>Screening circuit</b>       | Closed-circuit plants must match screen opening and return conveyor capacity; excessive return load reduces real capacity. |

## Capacity Data - CSS 6 to 25 mm

Unit: t/h. CSS refers to tight-side discharge opening / closed side setting in millimeters.

| Model    | 6 mm  | 8 mm    | 10 mm   | 13 mm    | 16 mm    | 19 mm    | 22 mm     | 25 mm     |
|----------|-------|---------|---------|----------|----------|----------|-----------|-----------|
| HPY-100  | 20-50 | 30-60   | 40-70   | 65-90    | 50-80    | 70-95    | 75-100    | 80-110    |
| HPY-200  | 40-70 | 60-100  | 80-120  | 130-180  | 110-150  | 140-190  | 150-200   | 160-220   |
| HPY-300  | -     | 100-130 | 110-140 | 170-220  | 145-185  | 190-240  | 200-260   | 220-280   |
| HPY-400  | -     | 115-150 | 130-175 | 220-280  | 180-230  | 240-320  | 270-345   | 280-370   |
| HPY-500  | -     | 140-170 | 170-220 | 270-360  | 225-290  | 310-400  | 335-430   | 350-450   |
| HPY-800  | -     | -       | 235-330 | 370-500  | 300-420  | 420-540  | 450-590   | 490-710   |
| HPY-1000 | -     | -       | 440-590 | 580-910  | 500-760  | 680-930  | 720-970   | 770-1000  |
| HPY-1250 | -     | -       | 630-840 | 840-1300 | 720-1080 | 980-1320 | 1040-1380 | 1100-1430 |

Use this section for fine and medium crushing comparison. Smaller CSS settings may improve fine material generation, but also increase liner wear and circulation load in closed-circuit plants.

## Capacity Data - CSS 32 to 64 mm

Unit: t/h. Wider CSS settings are usually used where higher throughput or coarser product is required.

| Model    | 32 mm     | 38 mm     | 45 mm     | 51 mm     | 64 mm     |
|----------|-----------|-----------|-----------|-----------|-----------|
| HPY-100  | 90-130    | -         | -         | -         | -         |
| HPY-200  | 180-235   | 200-250   | -         | -         | -         |
| HPY-300  | 240-320   | 295-380   | 340-440   | -         | -         |
| HPY-400  | 310-430   | 360-490   | 400-550   | 450-630   | -         |
| HPY-500  | 390-530   | 435-600   | 500-680   | 560-760   | -         |
| HPY-800  | 530-780   | 580-920   | 660-1000  | 750-1150  | -         |
| HPY-1000 | 950-1220  | 1120-1350 | 1260-1450 | 1540-1820 | 1600-2100 |
| HPY-1250 | 1360-1740 | 1600-1940 | 1800-2100 | 2200-2600 | 2600-3000 |

## Model Capacity Summary

| Model    | Full listed capacity range | Listed CSS range | Selection note                                     |
|----------|----------------------------|------------------|--|
| HPY-100  | 20-130 t/h                 | 6-32 mm          | Small to medium capacity fine / medium crushing.   |
| HPY-200  | 40-250 t/h                 | 6-38 mm          | Common smaller aggregate line model.               |
| HPY-300  | 100-440 t/h                | 8-45 mm          | Medium plant range; chamber choice affects output. |
| HPY-400  | 115-630 t/h                | 8-51 mm          | Higher capacity aggregate or ore crushing.         |
| HPY-500  | 140-760 t/h                | 8-51 mm          | Large aggregate plant or mining circuit.           |
| HPY-800  | 235-1150 t/h               | 10-51 mm         | High-capacity hard rock line.                      |
| HPY-1000 | 440-2100 t/h               | 10-64 mm         | Very large plant selection.                        |
| HPY-1250 | 630-3000 t/h               | 10-64 mm         | Large mining / aggregate systems.                  |

**Important note:** Values are technical references. Actual output depends on material density, feed grading, moisture, chamber selection, CSS, liner condition, screen size and circuit type.

Data basis: user-provided HPY technical parameter table, cross-checked with public HPY cone crusher product information on fixed-shaft structure, laminated crushing, multi-chamber selection, hydraulic protection and automation control.
